Smog-Hog Exchange Program

The *Smog-Hog Exchange Program* process involves:

1. Bring clean, checked out ESP cells and filters
2. Swap them with your dirty cells and filters
3. Check out the air cleaner, with the clean cells, ionizers, and filters.
 - a. Check the high voltage system
 - b. Check that the drain is functional
 - c. Check that the blower and motor are working
4. Notify you, and do any repairs needed, and approved.
5. Take the dirty cells and filters back to our facility, clean them and test them on high voltage, to ensure that they will work for the next job.

Included in this program is *any future cell or filter replacement*. As part of the exchange program, we bear the responsibility of keeping the cells functional and replacing them when they are not. This excludes any apparent damage caused by the customer, for example, a machine fire.

All waste water generated in the cleaning process is hauled away by a licensed waste hauler.
